

Technologies:

This buffer tank model provides the opportunity to accumulate thermal energy simultaneously

from two different heat sources, for example a solar system and a boiler. The flow-through heating principle and the large capacity provide a significant quantity of household hot water. The corrugated heat exchanger disposes with a large contact area and is made of so-called medical chrome-nickel steel brand AISI316L. This guarantees the preservation of the potable qualities of the hot water throughout the whole exploitation of the device.

- ENERGY SAVING - CFC free insulation of environmentally friendly formula of polyurethane foam of high density and thickness of 80 mm to ensure minimum heat losses;
- Terminals, convenient for installation and service;
- Circulation socket;
- Thermostat sockets;
- Venting plug.

Capacity range:	500
Energy efficiency class:	B
Dimensions ØxH [mm]:	800 x 1765
Water tank:	Non-enameled
Nominal pressure [MPa]:	0.3
Number of heat exchangers:	2
Standing loss [W]:	72
